

# Forkcast Mobile — Settings & App-Info Spec

What the Settings/Profile tab must contain. Benchmark: MenuFit’s settings screen (Edit Preferences / Terms / Privacy / Source of Data & AI / Contact / Feedback / Rate / Log Out / Delete Account) — we match all of it and add the transparency items that are Forkcast’s differentiators.

Canonical content lives at hosted URLs (required by both stores); the app can render the same content natively or in a web view:

- Privacy Policy → <https://seymurhh.github.io/forkcast-live/privacy/>
- Terms and Conditions → <https://seymurhh.github.io/forkcast-live/terms/>
- Source of Data & AI → <https://seymurhh.github.io/forkcast-live/data-and-ai/>

(Marked DRAFT pending legal review; URLs change if we move to a custom domain.)

## Settings screen — required rows, in order

**Profile & goals** 1. Edit profile & preferences — health profile, units (cm/kg ft/lb), dietary preferences, allergens, conditions. (Existing web **/profile**.) 2. Calibration status — “Where your targets come from”: formula vs calibrated, with the explainer. Differentiator; MenuFit has nothing like it. 3. Notifications — order status, daily log reminder (each individually toggleable; default log-reminder OFF — no nagging).

**Membership** 4. Membership — plan (Trial · day N of 7 / Free / Premium), price line \$4.99/mo · \$39.99/yr, Manage subscription (deep-link to store subscription settings), Restore purchases (required by Apple).

**Transparency & legal** 5. Source of Data & AI — provenance tiers, named AI providers, confidence & correction policy, allergy limits. (Improved MenuFit equivalent.) 6. Privacy Policy 7. Terms and Conditions 8. Permissions — location & camera: what each is used for, with links to system settings.

**Support** 9. Contact support — mailto (later: in-app form). 10. Give feedback 11. Rate Forkcast — StoreReview API (Apple limits prompts; the row is always allowed).

**Account** 12. Export my data — generates JSON of profile/logs/weights/orders (backend query is trivial with the existing tables; strengthens both store privacy forms and GDPR posture). 13. Log out 14. Delete account — REQUIRED by both stores. Two-step confirm → deletes the Supabase auth user (rows cascade per migration FKs) → local wipe → signed-out state. Copy must say deletion is permanent.

**About (footer of screen)** - Version + build, “Boston, MA”, link to Impact & methodology page. - Pilot honesty line: “Prototype integration — see order labeling.”

## Non-negotiables (product law — do not soften)

These carry from the web app and must appear in mobile equivalents:

1. Every nutrition value shows its provenance tier (partner-verified / published / estimated  $\pm$ ). No unlabeled numbers, ever.
2. Allergen/condition notices are advisories with the “confirm with the restaurant” line — on dish detail AND at checkout.
3. AI outputs show confidence, are editable before logging, and failures are shown (never a silently invented number).
4. Coach chat: not-medical-advice boundary; no diagnosis/medication advice.
5. Simulated/prototype states are labeled as such.
6. No third-party ads; health data never used for advertising (also an App Store 5.1.3 requirement).

## What we deliberately do better than MenuFit’s pages

- Their “Source of Data” names two APIs and stops. Ours explains the three provenance tiers, uncertainty labeling, named providers, correction versioning, and allergy limits — transparency as a feature,

on brand for a company whose pitch is evidence-first.

- Their privacy policy is generic web-era boilerplate (cookies, browsing). Ours is written to the actual data model (health profile, photos, location, AI processing) and commits to in-app deletion + export — which the stores' data-safety forms then simply restate.
