

Forkcast

Know what you'll eat, *before you sit down.*

Nutrition-aware restaurant recommendations. Plan what you'll eat out, match every dish to your goals, and track it — turning eating out from where diets fail into where they hold.

Pre-seed

Live demo: seymurhh.github.io/forkcast-live

THE PROBLEM

Eating out is the new normal — and it's where good intentions fall apart.

58.5%

of U.S. food spending is now eaten away from home — an all-time high

USDA ERS, 2023

2 in 3

diners underestimate a restaurant meal's calories; ¼ by 500+

USDA / NHANES, 2024

40.3%

of U.S. adults have obesity; another 31.7% are overweight

CDC NCHS, 2024

\$173B

annual U.S. medical cost of obesity alone

CDC, 2024

Restaurant meals run **~200 more calories and 350mg more sodium** than home cooking — and the obvious fix barely works: mandatory menu calorie labels change intake by only **~24 calories per order**. Passive disclosure that nobody acts on is the opening.

WHY NOW

Today's apps log *after* you've eaten. That's accounting, not coaching.

The category is broken

70–80% of calorie-tracking app users quit within two weeks — manual logging and inaccurate data, worst exactly when eating out.

AI is finally good enough

Grounding menu text + photos against trusted nutrition data cuts estimation error **63–83%** — “good-enough, easy to correct” is now real.

Capital is flowing

The GLP-1 / food-as-medicine boom is funding nutrition hard — and **AI took 62% of 2025 digital-health VC dollars.**

Forkcast flips the model: decide what fits *before* you order — when it can still change the outcome.

THE SOLUTION

Your body and goals become a daily eating-out plan.

01

Build your cabinet

Height, weight, age, goal → BMI, BMR/TDEE and macro targets, with real clinical formulas.

02

Get matched dishes

Every nearby dish gets a personal, explainable **Fit Score** — ranked for your day.

03

Order or walk in

Add it in one tap. Delivery, pickup, or just go — your plan updates instantly.

04

Snap to track

Photo-log what you ate; we reconcile it against your plan and weekly trend.

92

Char & Greens · Seaport · 1.9 mi

Blackened Salmon Bowl

Calories 580 / 700 left

Protein 40g · great

Sodium 600mg · low

High protein

Good fiber

THE PRODUCT · LIVE TODAY

Not a mockup — a working product.

- **Accounts & onboarding** — live BMI / TDEE / macro targets
- **Fit-Score discovery** — restaurants & dishes ranked to your goals
- **Interactive map** of nearby options with goal-matched pins
- **Dashboard** — daily rings, streaks, weekly & weight trends
- **AI photo logging** — snap a meal, confirm, track
- **Restaurant side** — menu → auto nutrition → featured placement

THE MOAT

The nutrition layer competitors can't buy off the shelf.

Chain-exact data

USDA FoodData Central + Nutritionix / FatSecret cover the 20+-location chains the FDA already forces to disclose. Table stakes — available to anyone.

Independent-restaurant estimation

our moat

No commercial database has nutrition for independent restaurants. We estimate it from menu name + description + photo, **RAG-grounded against trusted data (cuts error 63-83%)**, with confidence always shown — never "clinical."

Every user correction and partner-supplied menu compounds the data advantage — a moat a vision model alone can't replicate.

MARKET (U.S.)

A big, well-located market — sized bottom-up.

\$11.1B

TAM / year

~186M U.S. adults with elevated BMI (~72%), nearly all eat out, × ~\$60 blended ARPU. Matches the \$5.5–14B calorie-app market.

\$3.3B

SAM / year

~55.7M goal-oriented “active dieters” who eat out often × \$60. Near MyFitnessPal’s ~30M MAU ceiling.

\$40–90M

SOM • 5-yr ARR

0.5–2.0% of SAM + restaurant retail-media + B2B2C legs. Cal AI hit \$30M+ ARR in <2 yrs as the proof point.

BUSINESS MODEL

Three revenue legs, sequenced.

Launch leg

Consumer subscription

~\$60/yr blended, annual-led to fight churn. Transparent pricing + a useful free tier. Gate growth on $LTV:CAC \geq 3:1$.

Margin scaler

Restaurant retail-media

Clearly-labeled "featured healthy dish" at ~\$200/mo/location. 10,000 locations $\approx$ \$24M. DoorDash's \$1B+ ad model, ~90% margin.

Durable moat

B2B2C covered nutrition

Payer/employer contracts on reimbursable medical nutrition therapy (CPT 97802-04) — billable day one, "free to the user."

COMPETITION

The whitespace nobody owns.

PLAYER	STRONG AT	STRUCTURALLY ABSENT
MyFitnessPal	Scale (220M registered)	Logs after the fact; inaccurate DB; 70–80% 2-wk churn
Cal AI / SnapCalorie	Photo estimation, TikTok reach	No recommendation; no restaurant supply side
Sweetgreen / CAVA	Great healthy menus	Single-brand only — can't be brand-agnostic
DoorDash / Uber Eats	Restaurant graph + \$1B ad engine	Zero nutrition-goal intelligence
Foodsmart	Payer contracts, 2.2M members	Grocery/telehealth — not in-the-moment eating-out

One line: plan-ahead, location-aware dish recommendations for your goal — across chains *and* independents — with restaurants paying to be featured.

GO-TO-MARKET

Win density, not breadth.

0–12 mo

Boston beachhead

Dense, health-conscious metro (Harvard network). Seed full chain coverage; build independents block-by-block. Acquire via TikTok/influencer + GLP-1 audiences.

12–30 mo

Turn coverage into revenue

Convert restaurant coverage into the featured-dish leg; sign marquee logos; raise seed/Series A on retention proof.

30 mo+

Land the payer leg

Employer/payer B2B2C on covered nutrition — the durable moat. Likely exit: chain, delivery platform, or nutrition-care consolidator.

WHAT THIS ROUND PROVES

Pre-seed milestones (next 18 months).

>35%

D30 retention (vs. ~30% category)

150+

restaurants in pipeline · 10+ featured live

1,000

active users in one metro (from 100)

≥3:1

LTV:CAC, 6–9 mo payback

Retention is the category's true constraint — so we gate every dollar of paid acquisition on it. Plan-ahead turns every meal out into a recurring habit, not a logging chore.

FINANCIAL MODEL

Path to ~\$58M ARR and profitability by Year 4.

RECOGNIZED REVENUE	Y1	Y2	Y3	Y4	Y5
Consumer subscription	\$0.18M	\$1.5M	\$5.4M	\$13.2M	\$27.0M
Restaurant retail-media	\$0.06M	\$1.0M	\$3.6M	\$9.6M	\$21.6M
B2B2C covered nutrition	—	—	\$0.5M	\$3.0M	\$9.0M
Total	\$0.24M	\$2.5M	\$9.5M	\$25.8M	\$57.6M

~83% gross margin (AI inference ≈ \$0.003–0.015 / photo). Operating breakeven ≈ Year 4 as the high-margin restaurant + payer legs layer on. Full model available in the data room.

THE ASK

Raising ~\$1.0–1.5M pre-seed.

- ~\$1.0–1.5M SAFE (~\$5–6M post), plus a non-dilutive SBIR top-up
- 45% product & the independent-restaurant nutrition layer
- 28% Boston go-to-market & restaurant density
- 27% data/AI costs, ops & a dietitian advisor
- 18-month runway to the retention + restaurant proof for a seed

**Make eating out the
easiest place to hit your
goals.**
